

Compact Hydraulic System for
Energy Savings and High Precision

POWER Meister

Power Meister

Compact Hydraulic System for Energy Savings and High Precision **POWER Meister**

The AC servo motor controls rotational speed and direction of the pump.
The pump generates flow and pressure to match the operating cycle of machinery and stops during idle times.
Incredible energy savings are achieved by operating only when necessary.
Position, Speed and Pressure are controlled with great precision by using a high-speed digital processing servo controller.

- High Power: 30MPa (4350 PSI)
- Up to max flow 18.5 gpm **NEW**
- Pump Operates Only When Necessary for Energy Savings and Low Noise
- Superior Energy Savings Compared to Conventional Hydraulic Systems
- Highly accurate positioning to the Order of μm (0.001mm or 0.000039") due to high-speed processing of the servo controller
- Compact All-in-One Design Saves Space
(Select either vertical or horizontal setup)

Precision Control of Position, Speed and Pressure by Our Original Feedback System

Principle of Operation

Rotating the motor clockwise brings hydraulic fluid to the head-side of the cylinder which lifts the table. Reversing the motor brings hydraulic fluid to the rod-side and pushes the cylinder down. The rotational direction of the pump controls the direction of the cylinder.

System Configuration (Standard)

The hydraulic unit responds to signals to operate the cylinder (position, speed and pressure) that are sent from the Machine Controller to the Servo Controller. The Servo Controller receives feedback from sensors and accurately controls the cylinder so the deviation from the signal is 0. A feedback system using position and pressure sensors make it possible to accurately control Position, Speed and Pressure.

Power Meister Component Device

- ❶ Hydraulic Unit (UPS)
- ❷ Servo Controller (EPD)
- ❸ Servo Amplifier (For AC motor of 1)
- ❹ Motor Cable (3m, 5m or 10m) (10, 16 or 32 feet)
- ❺ Encoder Cable (3m, 5m or 10m) (10, 16 or 32 feet)
- ❻ Motor Fan Cable (choose from 3m, 5m, and 10m) used for UPS-1A: 11kW and UPS-2A: 20kW motor only.

Piping, wiring, hydraulic cylinder, sensor and control panel to be supplied by customer. (Please contact us about cylinders and sensors.)

Hydraulic Unit (UPS)

Space-Saving Design

In-line AC servo motor, hydraulic pump and reservoir. Relief valve and other valves are included in base unit. A port is discharge port when pump rotates counter-clockwise (viewed from AC servo motor). B port is discharge port when pump rotates clockwise. Piping are only between A&B ports of unit and ports of cylinder. Due to rotation of AC servo motor, cylinder can be extended or retracted.

Options

Additional options that improve usability of UPS: Differential pressure valves that cancel pressure imbalance and shut-off valve to prevent free-fall when motor power turned off are available as UPS options for self-load generation circuit. Temperature switch for abnormal oil temperature detection and float switch for abnormal oil level detection are also available.

Note) No differential pressure valve, shut-off valve, temperature switch, level switch option for UPS-00A. No shut-off valve, temperature switch, or level switch option for UPS-2A.

UPS-1A

UPS-00A

Hydraulic Circuit (UPS-0A, 1A, 2A)

UPS-2A rotation direction and discharge direction is opposite.

Hydraulic Circuit (UPS-00A)

When cylinder position retention required at servo motor off state and to avoid free-fall, use additional circuit such as shut-off valve, etc. Please ask separately.

Servo Controller (EPD)

Easy and Precise Control by High-Speed Calculation

Position sensor and pressure sensor feedback signals. According to cylinder load, servo controller commands to servo amplifier with calculating direction of rotation and rotation speed. Through high-speed calculation of servo controller, it is possible to operate cylinder easily and precisely with command and feedback control. The servo controller features an automatic changeover control mode function as standard. In accordance with actual load conditions, speed control and pressure control or position control and pressure control are automatically selected. Therefore, it is not necessary to control timing by changing the control modes with the host controller, and changing from speed control to pressurizing control can be done smoothly. This function can realize pressurizing control that does not generate surge pressure at the time of changeover. Contact signals from the host controller can also change the control modes.

Servo Amplifier (EPA)

Use a servo amplifier compatible for the servo motor installed in HPU.

The servo amplifier will activate servo motor to drive the pump according to the rpm command from servo controller.

Speed: Sine Wave Response

Hold Pressure: Electric Power Consumption Characteristics

Application Examples and Results

Metal forming Machines	Compact machine space, precise measures to manufacture.
Caulking Machines and Press Fitting Machines	Control power and position of caulking to maintain quality control. Conventional positioning mechanism not needed. Eliminates the inconsistency of work done by hand.
Grinding Machines	Precise position of start to grind, energy saving to maintain constant pressure for long periods.
Precision Press Machines	Smooth change from high speed to process without surge pressure, for improved quality of products. Less cycle time.
Straightening Machines	Energy saving, low noise, reduced fluid, space saving by integrating unit into machine. Less logistics cost.
Other Applications	Other applications include those requiring compact machines, and high load machines which are incapable of using ball screws.

Hydraulic Unit Specifications

Electric Motor	AC servo motor (0.75~20kW, driven by servo amplifier) (1.0~26.8HP) Power voltage Three-phase AC200~230V 50/60Hz (Servo Amplifier Power) Fan motor power: Single phase: AC200~230V 50/60Hz required. (UPS-1A: 11kW, UPS-2A: 20kW only)
Piston Pump	(2.0~35.0 cm ³ /rev) (0.12~2.13 in ³ /rev)
Ambient Temperature/Humidity	0~+40°C (32~104°F) / 20~90% RH
Fluid Temperature	5~60°C (41~140°F) (Note 6)
Recommended Fluid	UPS-00A, 01A, 1A: ISO VG32~68 (VG 46 recommended), UPS-2A: ISO VG 46 only
Range of Viscosity	20~200mm ² /s {cSt}
Cleanliness Level	NAS class 10 (ISO 18/16/13)
Setting Range of Relief Valve	UPS-00A:3.5~32MPa UPS-0A/1A/2A:3.5~
Maximum Pressure	30MPa (4350 psi) (Note 7) (Maximum working pressure varied by motor capacity and/or optional features.)
Color	Black

(Note 1) Available pressure at maximum rpm is limited due to the characteristics of motor as its torque output lowered during high speed rotation.

(Note 2) Theoretical flow rate at no load. Actual flow rate may vary by load pressure.

(Note 3) Rated pressure is the rated torque of motor and the maximum working pressure is at 150% torque which is output capable amount pressure. However, when these pressure types exceed 30MPa, hydraulic unit maximum working pressure will be limited to 30MPa.

(Note 4) When variable fluid amount is greater than allowable value, additional fluid can be supplied by connecting a secondary tank. Please contact us for more information.

(Note 5) When choosing a tankless type, oil tank is required separately. Nachi is available to make one for those customers requesting additional tank. Please contact us for more information.

(Note 6) Due to operating oil temperature impacted by various factors such as HPU installed environment, operation method and load conditions etc., ensure to check the oil temperature in HPU at working condition. Also, when using HPU under the long continuous pressure loading operation and very frequent cylinder operation, oil temperature gets high which could limit working pressure and/or require additional cooling system installation. Please contact us for more information.

(Note 7) When mounting an optional circuit, maximum working pressure gets limited as below.

- With differential pressure regulating valve (Code: C),
UPS-0A, UPS-1A, UPS-2A: Maximum working pressure 25MPa
- With Shut-off Valve (Code: S), UPS-0A, UPS-1A: Maximum working pressure 21MPa

[Precautions at selecting HPU]

Power Meister is the HPU system to drive hydraulic cylinder directly by motor rotations. Torque required for acceleration/deceleration other than motor torque required to create working pressure, feasible maximum flow rate and maximum working pressure could get regulated lower than the MPa listed above. Please ensure about the desirable working cycle and load in HPU (for Power Meister hydraulic cylinder) first and contact us.

Servo Controller Specifications

Model: EPD-PD3-10 -D2-20

Source Voltage/ Consumption	DC24V±15% / 10W maximum	Require separate power supply for sensor
Ambient Temperature/ Humidity	0~+55°C (32~131°F) / Under 90% RH	
Control	Control of position, speed and pressure for cylinder	Automatic change function of control mode
Command Input	Speed Command	Analog voltage DC±10V/Max. cylinder speed (*1) Expand cylinder by + voltage, contract by - voltage
	Pressure Command	Analog voltage DC±10V/Max. pressure (*2) Pressurize head side by positive voltage, pressurize rod side by negative voltage
	Position Command	Select contact signal to set positions (4 contacts). Select target position by bit pattern of 4 contacts. Controller calculates function of speed for targeted position and maintain.
Input Signal (Contact Signal)	Servo ON, alarm reset, external changeover signal for control mode. Point of origin search start signal, retracoin LS and proximity LS from/to point of origin.	
Output Signal	Alarm, servo ready, control mode monitor, point of origin search complete/in position (dual output), correspond with pressure	
Pressure Sensor Input	Analog voltage 0.5~4.5V or 1~5V (2ch)	Use pressure sensor with responsiveness under 1ms
Position Sensor Input	90° phase difference 2 phase pulse. Point of origin pulse (line receiver input) or analog voltage 0~10V.	If using position sensor for pulse output, point of origin search required after power-up. - Position sensor for pulse output: Under 1μm of resolution. - Position sensor for analog voltage output: Under 2ms responsiveness.
Servo Amplifier Signal I/F	Output: Motor rotation speed command (Analog voltage DC±10V), Servo ON, Servo alarm reset. Input: Servo alarm, servo ready.	
Operation Panel	5-digit display with code, 4-key input, selector switch.	Data setting, display and trial operation function

- Connector and pin to connect controller are supplied.
- When used spacer for servo controller (Option: FZV-8676-02A-01), set dimension becomes the same as the former design [EPD-PD2-10(-A)-D2-10] and the connector height from the set surface also gets to be almost the same.

Servo Amplifier Specifications

Hydraulic Unit (UPS)	Motor Output kW (HP)	Corresponding Servo Amplifier Type	Note
UPS-00A-**07	0.75 (1.00)	EPA-PD1-10-R075-20	Built-in regenerative resistor

450 : 4.5kW, 550 : 5.5kW, 750 : 7.5kW
11K : 11kW, 15K : 15kW, 20K : 20kW
- Applicable Motor Type R:R2 Series servo motor
- Motor cable
- Cable Length
03 : 3m, 05 : 5m, 10 : 10m

Motor Fan Cable Kit

JAQ-03ACF-R20K-L-20

- Design No.
- Connector Configuration -: Straight Plug
L: L Plug
- Applicable servo motor and Capacity -: R2 series servo motor
11kW (For UPS-1A)
R20K:R2 series servo motor
20kW
- Motor Fan Cable
- Cable Length
03 : 3m, 05 : 5m, 10 : 10m

Encoder Cable Kits

JAQ-03ACE-RA-L-20

- Design No.
- Connector Configuration -: Straight Plug L: L Plug
No code with connector type B or Motor Capacity 20kW.
- Connector Type
A: Cannon connector (for 1.2kW ~20kW)
B : Dsub connector (0.75kW, 1.0kW)
- Applicable Motor Type:
R:R2 series servo motor
- Encoder Cable
- Cable Length 03: 3m, 05: 5m, 10: 10m

PC Cable Kits

JAQ-03PMC-8654A

Available to set parameters, to backup and to monitor from PC with use of PC cable kits.

*Utility software can be used in common for bot EPD-PD2-10(-A)-D2-10 and EPD-PD3-10-D2-20.

Warning

- Drastic acceleration during operation may shorten the life of hydraulic unit. When abnormal noise such as impact noise occurs from HPU, it indicates that an intensive torque had occurred. Please review your operation command and/or limit servo amp torque.
- When depressurizing HPU by reverse of servo motor, ensure to release pressure slowly to avoid sudden torque change. When shorter pressure release time required, another method such as additional depressurizing circuit (valve exclusive for pressure release) available to install.
- The safety valve installed in HPU is to protect hydraulic circuit protection in the event of emergency. Safety valve should never be activated during regular operation. Please ensure to adjust and regulate your set pressure to avoid this valve activation. When safety valve gets activated, fluid temperature will rapidly raise and cause issues.
