

PVS Series Variable Volume Piston Pumps 8.0 to 45.0cm³/rev 21MPa

- ❖ Design No. 30 is applied on PVS-0B to make the pump more compact and lighter, and reduce noise.
- ❖ Production of PVS-3B has been discontinued. Use PZS-3B.
- ❖ Pressure adjustment 3 type has been added to PVS-1B-22 and PVS-2B-45. (Design No. 20 is applied only on PVS-2B-45*3.)

Features

Energy-saving Type with Drastically Reduced Loss

A NACHI-proprietary semi-circular barrel swash plate that receives pressure on its surface ensures a stable discharge volume at all times. This eliminates excess

discharge volume, and enables the effective use of power corresponding to the load cycle.

This "energy-saving type" conserves energy, reduces power loss, and helps to reduce hydraulic costs.

Silent Type That Demonstrates Its Power Quietly

Proprietary low-noise mechanisms are incorporated on the shoe, swash plate, valve plate, and other locations to ensure silent operation. In particular, a semi-circular barrel swash plate stabilizes operation characteristics to ensure silent operation.

- Handling
- Cautions during Pump Installation and Piping

- 1 Use flexible couplings for connecting the pump shaft to the drive shaft, and prevent a radial or thrust load from being applied on the pump shaft.
- 2 For centering of the pump shaft, limit the eccentricity between the drive shaft and hydraulic pump shaft to 0.05 mm, and keep the angle error within 1°.
- 3 Set the length of insertion between coupling and hydraulic pump shafts so that it is within at least 2/3 or more of the coupling width.
- 4 Use a sufficiently rigid pump mounting base.
- 5 Set the pressure on the pump suction side to -0.03 MPa or more (suction port flow velocity within 2 m/sec).
- 6 Raise part of the drain piping to above the topmost part of the pump body, and insert the return section of the drain

piping into the hydraulic fluid. Also, observe the values in the following table to limit the drain back pressure to 0.1 MPa.

Model No.	PVS-0B	PVS-1B	PVS-2B
Pipe joint size	3/8" or more	1/2" or more	
Pipe I.D	φ7.6 dia or more	φ12 dia or more	
Pipe length	1m or less	1m or less	

- 7 Mount the pump so the pump shaft is oriented horizontally.

● Management of Hydraulic Operating Fluid

- 1 Use good-quality hydraulic operating fluid, and use within a kinematic viscosity range of 20 to 200 mm²/sec during operation. Use an R&O type and anti-wear hydraulic fluid of ISO-VG32 to 68. The optimum kinematic viscosity during operation is 20 to 50 mm²/sec.

- 2 The operating temperature range is 5 to 60°C. When the oil temperature at start-up is 5°C or less, warm up the hydraulic pump by low-pressure, low-operation speed operation until the oil temperature reaches 5°C.

- 3 Provide a suction strainer with a filtering grade of about 100μm (150 mesh). Be sure to provide a return line filter of grade 20μm or less on the return line to the tank. (When the hydraulic pump is used at a high pressure of 14 MPa or more, we recommend providing a filter of 10μm or less.)

- 4 Manage the hydraulic operating fluid so that contamination is maintained at class NAS10 or lower.

- 5 Use hydraulic operating fluid within an operating ambient temperature of 0 to 60°C.

(continued on following page)

● Inverter Drive Precautions

- ① Set the revolution speed within the range of the pump specification revolution speed.
- ② Changing the revolution speed may also affect the pump performance curves. Before using the inverter, check if the pressure and motor load factor are within the range of use.

● Cautions at Startup

- ① Before you start pump operation, fill the pump body with clean hydraulic fluid via the lubrication port.

Model No.	Injection amount cm ³
PVS-0B-8	220
PVS-1B-16, 22	300
PVS-2B-35, 45	650

- ② An unload is required when the motor is started under condition λ-Δ. Consult your agent regarding the circuit.

- ③ Make sure that the pump operates in the direction of rotation the same as that indicated by the arrow on the pump body.
- ④ Air entering to the pump or pipes may cause noise or vibration. At startup, set the pump discharge side to a no-load state, and operate the pump in the inching mode to release any air in the pump or pipes.
- ⑤ Provide an air bleed valve in circuits where it is difficult to release air at startup. (See "IP Pumps" on page C-13.)

● How to Set Pressure and Discharge Volume

For the factory default pump discharge volume is set to "maximum" and discharge pressure is set to "minimum". Change the discharge volume and discharge pressure settings according to your particular operating conditions.

[Pressure adjustment]
Turning the pressure adjusting screw CW increases the pressure.

[Discharge volume adjustment]
Turning the flow rate adjusting screw CW decreases the discharge volume.

Note)

- For details regarding the relationship between flow rate adjustment length ℓ and pump capacity q, see the tables provided in the installation dimension drawings for each of the pumps.
- Firmly tighten the lock nuts after you have finished adjustments.

Variable Control Mechanisms

Standard type

Symbol	External View	Characteristics	Hydraulic Circuit	Explanation
N				<p>Pressure compensation type (manual system)</p> <p>When the discharge pressure reaches the preset pressure set by the pressure compensator, the discharge rate is automatically reduced to hold the pressure at the set pressure (full cutoff pressure).</p>

Option type

P				<p>Pressure compensation type (remote control mode)</p> <p>This mode demonstrates the same characteristics as the manual mode.</p> <p>The full cutoff pressure can be adjusted by external pilot pressure. The discharge rate can be adjusted manually. Note 2)</p>
NQ				<p>2-pressure, 2-flow rate control type</p> <p>The discharge volume changes in two stages by the pump's built-in sequence valve. This allows conventional high/ low pressure control to be performed on a single pump unit, and save energy in the hydraulic circuit.</p>
RS (RA)				<p>Solenoid cutoff control type</p> <p>A solenoid valve for unload is integrated into the pressure compensation type to minimize energy loss when pump output is not required. Only a slight amount of heat is generated.</p>
WS (WA)				<p>2-pressure control type</p> <p>Two pressure compensation types can be obtained by switching the solenoid valve ON/OFF.</p> <p>Two types of pressure control are possible with the actuator set to a constant speed.</p>
RQS (RQA)				<p>2-pressure, 2-flow rate control type w/ solenoid cutoff</p> <p>The discharge volume can be changed in two stages by the sequencer valve and solenoid valve for unload mounted on the pump, and unloading is possible when pressure oil is not required.</p>
CS (CA)				<p>2-cutoff control type</p> <p>Two types of pressure - flow rate characteristics can be obtained by the solenoid valve and cylinder mounted on the pump.</p>

Note 1) Many other variable control mechanism are also available in addition to those in the above table. Please consult your agent for details.
 Note 2) We recommend ZR-T02-*5895* as the remote control valve. For details, consult your agent. The pipe volume up to the remote control valve should be less than 150cm³.

- Notes) 1. The piping flange is on sale in the Flange Kit which includes mounting bolts, washers and O-rings.
2. The materials and hardness of the O-ring conform with JIS B2401
3. For details on tightening torque, see page C-11.

Uni-pump Specifications

(CE mark standard compliant)

Explanation of model No.

UPV - 1 A - 16 N 1 - 1.5 * - 4 * - * - 30(50)

Motor selection curves

• How to select the motor

The lower side of the output curves for each of the motors shown above indicates the operating range under rated output for that motor.

- * Select a uni-pump that has a pressure and flow rate that is within the range of the drive so that the drive will not overload.
- * When the startup current of the uni-pump becomes higher for the IE1 motor, breakers may need to be changed.

1. Drive motor is fully enclosed fan cooled, 0.75 to 3.7 kW is E type, and 5.5 to 7.5 kW is B type.
2. Standard voltage for drive motor is 200 VAC, 50/60 Hz or 220 VAC, 60 Hz.
3. Viewed from the pump side, suction port is on the left and discharge port is on the right.
4. Broken lines indicate instances for the A terminal. Broken lines pass through to the other side of the pump along its center.
5. See page (A-21) for the dimension table and characteristics of drive motor.
